## At page 3 change the first line to read as follows:

 $b\nu$ 

Fig. 2 is a graph of power transmitted vs. fiber position for prior art

apparatus;

On page 3, change line 6 to read as follows:

133

Fig. 4 is a graph of refractive index variation with distance from the launch end of a fiber in accordance with the principles of this invention.

At page 3, change line 9 to read as follows:

134

Fig. 6 is a block diagram of a system using the fiber of Figs. 1 and 3.

At page 3, change line 10 to read as follows:

BS

Fig. 7 is a block diagram of a further system using the fiber of

Figs. 1 and 3.

At page 4, beginning at line 1, change to read as follows:

where  $P_0$  is the power at the input end of the fiber, P is the power at a distance 1 from the input end, a is the core radius,  $\alpha$  is the absorption coefficient of the cladding,  $n_{co}$  and  $n_{cla}$  are the core and cladding refractive indices, N is a common mathematical designation for the number of segments used for the calculation; it represents the number of positions to which the calculation is applied, and  $\eta_i$  is the fraction of the power carried by core guided modes.

At page 7 please enter the following change:

An optical fiber having a core of F-2 Schott glass with a diameter of 100 micrometers and a cladding of polymer with a thickness of 20 micrometers was fabricated and a twenty meter length of the fiber was tested at 850nm (active wavelength) as a moisture sensor. A reference wavelength of 1300 nm also was used. A dry
